Create a resource group

Basics Tags Review + create

Resource group - A container that holds related resources for an Azure solution. The resource group can include all the resources for the solution, or only those resources that you want to manage as a group. You decide how you want to allocate resources to resource groups based on what makes the most sense for your organization. [Learn more](#)

Network security group security rules are evaluated by priority using the combination of source, source port, destination, destination port, and protocol to allow or deny the traffic. A security rule can't have the same priority and direction as an existing rule. You can't delete default security rules, but you can override them with rules that have a higher priority. 5) Configure for resource group and virtual network to protect from accidental delete.

The screenshot shows the Microsoft Azure portal interface. On the left, the 'Resource Manager | Resource groups' page is visible, with a list of resource groups including 'nikhil-rg-asgmt-az900'. The main pane shows the 'nikhil-rg-asgmt-az900 | Locks' page. An 'Add lock' dialog box is open, prompting for a lock name (RG-LOCK), lock type (Delete), and notes (Prevent full resource group removal). The dialog has 'OK' and 'Cancel' buttons.

The screenshot shows the Microsoft Azure portal interface. On the left, the 'Network foundation | Virtual networks' page is visible, with a list of virtual networks including 'nikhil-VNET-Main'. The main pane shows the 'nikhil-VNET-Main | Locks' page. An 'Add lock' dialog box is open, prompting for a lock name (VNET-LOCK), lock type (Delete), and notes (Prevent accidental VNet deletion). The dialog has 'OK' and 'Cancel' buttons.

The screenshot shows the Microsoft Azure portal interface. The main content area displays the 'nikhil-VNET-Main' Locks page. The page title is 'nikhil-VNET-Main | Locks'. Below the title, there is a table of locks. The table has four columns: Lock name, Lock type, Scope, and Notes. The table contains two rows of data: RG-LOCK and VNET-LOCK. The RG-LOCK row shows a lock type of 'Delete' and a scope of 'nikhil-rg-asgmt-az900'. The VNET-LOCK row shows a lock type of 'Delete' and a scope of 'nikhil-VNET-Main'. The Notes column for RG-LOCK says 'Prevent full resource group removal' and for VNET-LOCK says 'Prevent accidental VNet deletion'. The page also includes a search bar, a 'Create' button, and a 'Manage view' dropdown. The bottom of the page shows the Windows taskbar with the date and time as 21:30 on 30-05-2026.

Lock name	Lock type	Scope	Notes
RG-LOCK	Delete	nikhil-rg-asgmt-az900	Prevent full resource group removal
VNET-LOCK	Delete	nikhil-VNET-Main	Prevent accidental VNet deletion

2) Configure the Apache service and verify HTTP and HTTPS connections to the web server.

The screenshot displays the Microsoft Azure portal interface. On the left, the 'Virtual machines' section is expanded, showing a list of VMs including 'nikhil-MgmtVM' and 'nikhil-WebVM'. The main pane shows the 'Overview' page for 'nikhil-WebVM'. Key details include:

- Resource group:** nikhil-rg-az900
- Status:** Running
- Location:** Central India
- Subscription ID:** 40e55994-4306-48be-833a-78897eb08932
- Operating system:** Linux (ubuntu 24.04)
- Size:** Standard B2as v2 (2 vcpus, 8 GiB memory)
- Primary NIC public IP:** 20.204.122.98
- Virtual network/subnet:** nikhil-VNET-Main/nikhil-WebTier
- DNS name:** Not configured
- Health state:** -
- Time created:** 5/29/2026, 8:34 AM UTC

The 'Properties' tab is active, showing details like 'Computer name: nikhil-WebVM', 'Operating system: Linux (ubuntu 24.04)', 'VM generation: V2', 'VM architecture: x64', 'Agent status: Ready', 'Agent version: 2.15.2.1', 'Hibernation: Disabled', 'Host group: -', 'Host: -', and 'Proximity placement group: -'. The 'Networking' section shows the 'Public IP address' as 20.204.122.98, with a note '1 associated public IP'.

Apache2 Default Page

Ubuntu **It works!**

This is the default welcome page used to test the correct operation of the Apache2 server after installation on Ubuntu systems. It is based on the equivalent page on Debian, from which the Ubuntu Apache packaging is derived. If you can read this page, it means that the Apache HTTP server installed at this site is working properly. You should **replace this file** (located at `/var/www/html/index.html`) before continuing to operate your HTTP server.

If you are a normal user of this web site and don't know what this page is about, this probably means that the site is currently unavailable due to maintenance. If the problem persists, please contact the site's administrator.

Configuration Overview

Ubuntu's Apache2 default configuration is different from the upstream default configuration, and split into several files optimized for interaction with Ubuntu tools. The configuration system is **fully documented in `/usr/share/doc/apache2/README.Debian.gz`**. Refer to this for the full documentation. Documentation for the web server itself can be found by accessing the **manual** if the `apache2-doc` package was installed on this server.

The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:

```
/etc/apache2/
|-- apache2.conf
/   |-- ports.conf
|-- mods-enabled
/   |-- *.Load
/   |-- *.conf
|-- conf-enabled
/   |-- *.conf
|-- sites-enabled
/   |-- *.conf
```

- `apache2.conf` is the main configuration file. It puts the pieces together by including all remaining configuration files when starting up the web server.
- `ports.conf` is always included from the main configuration file. It is used to determine the listening ports for incoming connections, and this file can be customized anytime.
- Configuration files in the `mods-enabled/`, `conf-enabled/` and `sites-enabled/` directories contain particular configuration snippets which manage modules, global configuration fragments, or virtual host configurations, respectively.
- They are activated by symlinking available configuration files from their respective `*-available/` counterparts. These should be managed by using our helpers `a2enmod`, `a2dismod`, `a2ensite`, `a2dissite`, and `a2enconf`, `a2disconf`. See their respective man pages for detailed information.
